

MINOR PROJECT #1 REPORT

MY DATA, MY STORY

Personal Activity Intelligence Report

Student Details	Info
Student Name	Bhuvanagiri Gireesh
Registration / Roll No.	26116142 / 12627043
Program / Section	MCA
Activity Recording Period	13 th August 2026 To 21 st September 2026
Date of Report Generation	22 nd September 2026

1. Activity Data Summary

Particular	Value
Expected number of days	40
Valid days recorded	40
Missing days	0
Invalid / excluded records	0
Average Sleep/day	402
Average Fitness/day	27.5
Average Study/day	99
Average Coding/day	38.25
Average Class/day	216
Average Other Activities/day	82.75
Average Free / Unaccounted Time/day	574.5

2. Index Values

Enter the final value generated by your Python program. The activity indicators are based on simple averages across valid recorded days. PAI is calculated using the predefined weights shown below.

Index Name	Acronym	Formula	Value to Enter
Personal Activity Index	PAI	PAI = 0.15(TPI) + 0.20(AAI) + 0.15(PhAI) + 0.20(SRI) + 0.15(TUI) + 0.10(EI) + 0.05(DCI)	288.55
Tech Productivity	TPI	TPI = Average(Coding Time per valid recorded day)	<u>38.25</u> min/day
Academic Activity	AAI	AAI = Average(Study Time + Class Time per valid recorded day)	<u>315.0</u> min/day
Physical Activity	PhAI	PhAI = Average(Fitness Time per valid recorded day)	<u>27.5</u> min/day
Sleep & Recovery	SRI	SRI = Average(Sleep Time per valid recorded day)	<u>402</u> min/day
Activity Balance	ABI	ABI = Average(Free / Unaccounted Time per valid recorded day)	<u>574.5</u> min/day
Time Utilization	TUI	TUI = Average(Total Tracked Time per valid recorded day)	<u>865.5</u> min/day
Experience Index	EI	EI = Average of daily (Feeling Score + Satisfaction Score + Energy Score) / 3	<u>4.61</u> / 5
Data Continuity Index	DCI	DCI = (Valid Recorded Days / Expected Days) × 100	<u>100</u> %

Formula references: All time values are taken directly from the activity record and averaged across valid recorded days. Feeling, Satisfaction and Energy are scored using the prescribed 5/4/3/2/1, 5/4/3/2/1 and 3/2/1 scales respectively. PAI uses the predefined weights shown above. DCI rewards complete and continuous recording from 13 August 2026.

3. Key Findings from My Data

No.	Correlation/Observation	Evidence from my data
1	Sleep ↔ Energy	Averaging 402 minutes (~6.7 hours) of sleep
2	Study ↔ Satisfaction	Spending 315 minutes (5.25 hours) on academics
3	Coding ↔ Energy	Dedicating 38.25 minutes daily to coding

4. Findings About Myself (100–200 words)

Write about what your activity data revealed about your habits, priorities, consistency, balance, academic/technical engagement, and the relationship between activities and your reported experience.

Looking closely at my 40 days of tracked data, I found out that I am highly disciplined when it comes to routines and consistency. Tracking my data perfectly for 40 straight days with a **100% Data Continuity Index** proves that I can stick to a goal when I put my mind to it.

Academically, I prioritize my responsibilities heavily, dedicating a total of **315 minutes daily** to attending classes and studying. While my tech productivity is steady with about **38 minutes of coding** each day, my data reveals a massive chunk of **574.5 minutes of free or unaccounted time**. This vast open space is likely why my Experience Index sits at a fantastic **4.61 out of 5**

Overall, my life is peaceful and stable, though it leans heavily toward passive free time rather than active development.

5. Areas and Ways to Improve My Lifestyle (100–200 words)

Identify the areas you would like to improve and describe specific, realistic ways in which you intend to improve them based on the evidence from your data.

While my high experience score shows I am happy and balanced, my data clearly highlights two key areas where I can optimize my lifestyle: physical fitness and tech productivity. Right now, I only spend **27.5 minutes a day on fitness**, which is a bit low. I intend to take at least **30 minutes** from my **574.5 minutes of free time** and shift it into a structured workout or running routine to improve my physical health.

Additionally, my coding time averages just under **40 minutes a day**. Since I have plenty of unaccounted hours, I want to convert **60 minutes** of that idle time into focused, project-based coding. This will double my tech productivity without cutting into my sleep or classes, maximizing my potential while keeping my stress levels beautifully in check.

6. Student Declaration

I confirm that the values entered in this report have been generated from my submitted activity data using my Python program and that the report represents my own analysis.

Student Name	Signature	Date
